

How Votara Works — Secure, Scalable On-Chain Governance on Solana

Votara enables DAOs to run fast, transparent governance using Solana’s high throughput. Below we break down wallet connection, identity models, the proposal lifecycle, on-chain mechanics, and the UX timelines you can expect — including sub-second confirmations in typical conditions.

- Start a Proposal
- Read Developer Docs
- Join Community

Wallet Connection (Solana wallets)

Connect with Phantom, Solflare, Slope or Ledger. Votara requests a signature to authenticate and then creates a nonce-signed session for secure actions.

- Click Connect → choose wallet
- Approve session signature (no private key sharing)
- Optional hardware wallet for added security

Quick Stats

- Recent successful votes
- Treasury Allocation #219 — Passed (2,340 votes)
 - Grants Round Q2 — Passed (1,102 votes)
 - Protocol Param Update — Failed (834 votes)

FAQ

Is my wallet safe when connecting?

Yes. Votara only requests standard message signatures to verify ownership; private keys remain in your wallet. For enhanced safety, use hardware wallets like Ledger.

How does delegation work?

Delegation assigns your voting weight to another address on-chain and can be revoked any time via a signed transaction.

What’s the difference between token and NFT voting?

Token voting weights are proportional to fungible token balances; NFT voting grants rules-based access per token holdings (e.g., 1 NFT = 1 vote).

How much does voting cost?

Single vote transactions are typically a fraction of a cent on Solana; complex executions may incur more compute costs. Votara batches actions to minimize fees.

Developer Resources

Integrations, SDKs, and full API references for building governance-forward apps.

SDK

API Docs

Identity Options

Choose how voting power is represented and how participants qualify to vote.

Token-weighted Voting

Votes proportional to token holdings. Ideal for treasury & funding decisions.

Example: 1,200 VOTE tokens = 1.2k voting weight

NFT-gated Voting

Ownership of a qualifying NFT grants voting rights. Great for collector DAOs.

Example: Holders of ‘FoundersPass’ NFT

Delegated Voting

Delegate your weight to a representative. Delegation can be revoked on-chain.

Example: Delegate to core team lead for governance cycles

Proposal Lifecycle

From idea to execution: Votara standardizes lifecycle stages and on-chain hooks.

Draft

Author prepares title, description, metadata and required thresholds.

Visibility: Private until ‘Submit for Review’

Review

Community or moderators review, request changes, or approve for voting window.

Typical review window: 24–72 hours

Vote

Votes are cast on-chain. Quorum & threshold checks run at finalization.

Voting window: configurable (e.g., 48 hours)

Finalize

Results are recorded on-chain; execution scripts or multisig transactions are prepared.

Execution can be batched or scheduled

Lifecycle Details

Proposal metadata stored on Arweave/IPFS; anchors on Solana for integrity

Vote casting writes a compact instruction referencing proposal ID and voter signature

Finalization verifies thresholds, emits a finalized state, and may trigger governance executors

On-chain Transaction Mechanics

Understand how Votara constructs Solana transactions to scale governance actions and minimize costs.

Batching & Instructions

Multiple governance instructions are batched into a single transaction when possible to reduce overhead and exploit parallelism across accounts.

Example: Cast votes for multiple proposals in one atomic transaction where allowed.

Receipts & Storage

Compact receipts are emitted as transaction logs and can be parsed by indexers. Large payloads are stored off-chain with content-addressed anchors on Solana.

Votara relayer: a single Solana transaction containing multiple governance instructions" height="180px"

UX Timeline Visuals — Sub-second confirmations

Typical user experience metrics under normal network conditions.

Send Transaction

Client prepares and signs

~0–100 ms

Node Acceptance

Network accepts the transaction

~100–500 ms

Confirmation

Confirmed by leader/cluster

~200–800 ms

Finalize

State is finalized and indexers pick up logs

~1–3 s

Governance Best Practices

- **Clarity First**
Write a concise title and goal so voters instantly understand outcomes.
- **Appropriate Timing**
Allow enough voting window for participants across timezones.
- **Eligibility**
Use token/NFT gates thoughtfully to avoid unnecessary exclusions.
- **Security**
Preview on testnet and run validations before publishing on mainnet.

Proposal #312: Allocate funds for cross-chain bridge bounties

by Elena Martinez • 2026-04-02

Voting

Export CSV

Export JSON

A proposal to allocate 150 ETH across L2 solutions to incentivize secure bridge audits and bounty payouts aimed at cross-chain reliability improvements.

For: 44% • Against: 30% • Abstain: 26%

Proposal #309: Introduce quadratic funding pilot for public goods

by Arjun Singh • 2026-03-25

Draft

Export CSV

Export JSON

Proposal to run a 3-month quadratic funding experiment to support open-source infrastructure maintained by DAO members and community maintainers.

For: 68% • Against: 20% • Abstain: 12%

Proposal #298: Update token emission schedule

by Collective Ops • 2026-02-10

Closed

Export CSV

Export JSON

Adjust the emission curve to reduce inflationary pressure over the next 18 months and allocate reserve for ecosystem grants.

For: 92% • Against: 5% • Abstain: 3%

Mara Karimi

Thanks everyone—this funding will accelerate community grants for new builders.

Apr 29, 2026 • 2:30 PM

Amir Lee

Would prefer staged disbursement tied to milestones; propose quarterly audits.

Apr 29, 2026 • 1:10 PM

DAO Council

Council approves conditional release based on milestone reports.
